

WOOD TECH™

Product Description

WOOD-TECH™ is a clear gloss, semi-transparent or full color, penetrating, 100% acrylic wood and deck sealer. It resists moisture penetration and subsequent rotting and decay by penetrating, sealing, waterproofing and protecting wood surfaces. It is a high technology waterborne formulation that retards the aging process (silvering) of new, unexposed fresh wood. It has excellent mildew resistance and possesses ultraviolet resisting chemicals that slow down the damaging effects of the sun's U.V. rays. It protects and beautifies wood surfaces for up to 5 years depending on atmospheric conditions and geographic region. Longevity and wear is relative to the amount of foot traffic to which the product is subjected. Periodic recoating of high traffic areas may be necessary. The ultimate combination of acrylic resin and additives form a wood finish that is soft enough to expand and contract with porous wood, yet is durable and hard enough to accommodate deck traffic. When coating begins to wear with age, prepare the surface (see surface preparation), and re-coat.

Surface Preparation & Application

For proper adhesion and penetration it is essential that the surface is prepared properly. Pressure wash all wood with a water and chlorine solution using at least 1500 P.S.I. to remove any previous coatings, mildew, dirt, grease, grime, and other foreign materials. If wood is weathered and has remained dark or silver gray after pressure washing, apply a solution of 1 part chlorine and 2 parts water and scrub with a stiff brush. All wood should be lightly sanded with 80 to 100 grit sandpaper. Additional sanding may be required on new wood to remove mill glaze. Pressure wash again. Pressure treated wood must be weathered, dried and aged a minimum of 6 months before coating. All surfaces must be completely dry before applying WOOD-TECH™. Do not coat soaked, wet or moist wood with this product!

Excellent recoatability; Simply clean and prepare the surface and re-coat as needed.

NOTE: The above colors are typical representations of the final appearance. Since the semi-transparent stain is formulated to allow the grain texture and wood color to show through, the wood color itself will determine the final appearance. To see the finished color, brush out a small spot in an inconspicuous area. All colors are approximate and are not guaranteed to be exact.
